# What Is an API?

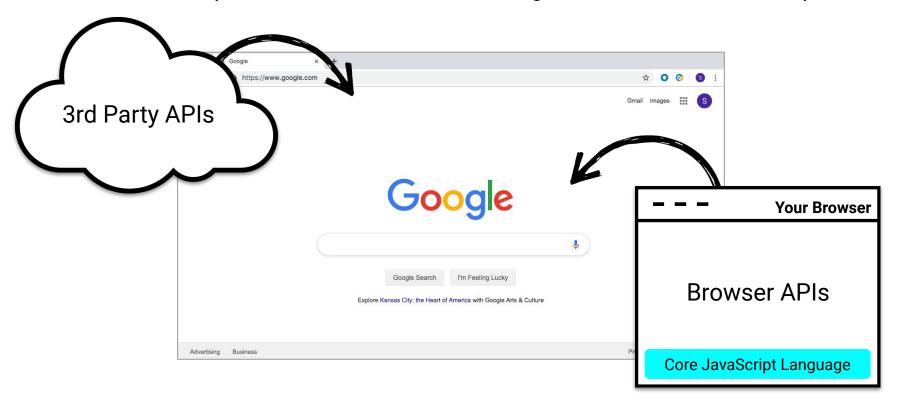

# An application programming interface (API) is a set of features and rules that exist inside a software program (the application) enabling interaction with it through software—as opposed to a human user interface.

- MDN Web Docs, developer.mozilla.org

# **API Recap**

In software development, APIs are often the bridge between different components.

### Three Common Use Cases for APIs

01

Provide pre-built code for accessing and sending data to a centralized database (e.g., weather data, movie data from IMDB).

02

Provide pre-built code for creating or utilizing other software components (e.g., Google Maps, Spotify tools).

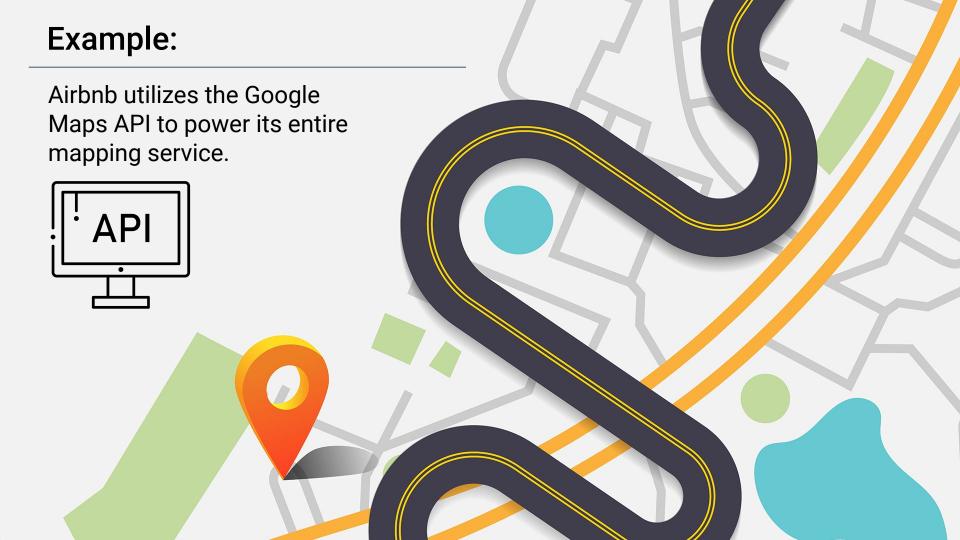

Interface with physical sensors or hardware devices (e.g., Nest thermostats, Philips Hue).

# Use Case #1:

Accessing and Sending Data

# **Use Case #2:**Utilizing Pre-Built Code

# Use Case #2: Utilizing Pre-Built Code

```
var context:
      var request;
      var source;
 4
 5
      try {
 6
        context = new AudioContext();
        request = new XMLHttpRequest();
        request.open("GET", "http://jplayer.org/audio/mp3/RioMez-01-Sleep_together.mp3", true);
        request.responseType = "arraybuffer";
 9
10
11
        request.onload = function() {
          context.decodeAudioData(request.response, function(buffer) {
12
13
            source = context.createBufferSource();
14
            source.buffer = buffer;
            source.connect(context.destination);
15
16
            // auto play
17
            source.start(0); // start was previously noteOn
          3);
18
19
        1:
20
21
        request.send();
22
23
      } catch(e) {
24
        alert('web audio api not supported');
25
```

developer.mozilla.org

# Use Case #3:

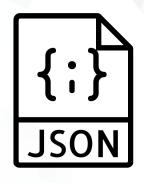

# Controlling Physical Hardware

Nest Smart Thermostat API: <u>developer.nest.com</u>

Philips Hue API: <u>developers.meethue.com</u>

NodeBots (Cylon.js) API: cylonjs.com

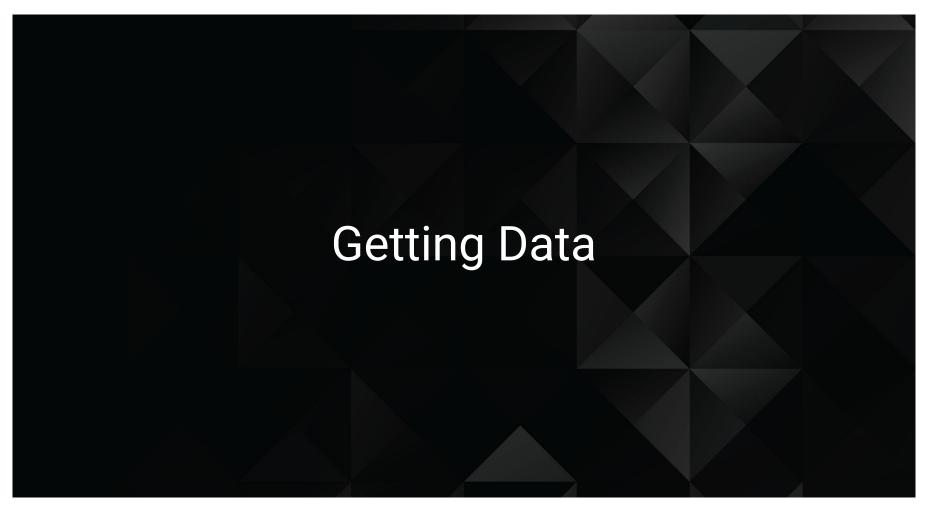

What Is JSON?

JSON stands for JavaScript Object Notation and is nothing more than simple JavaScript objects used as a data interchange format.

# **JSON Recap**

JSON is a lightweight data interchange format used to correlate keys with values.

```

What **jQuery method** do we use to retrieve data from a URL database?

What **two parameters** do we pass into AJAX to retrieve data from online?

### **AJAX**

What two parameters do we pass into AJAX to retrieve data from online?

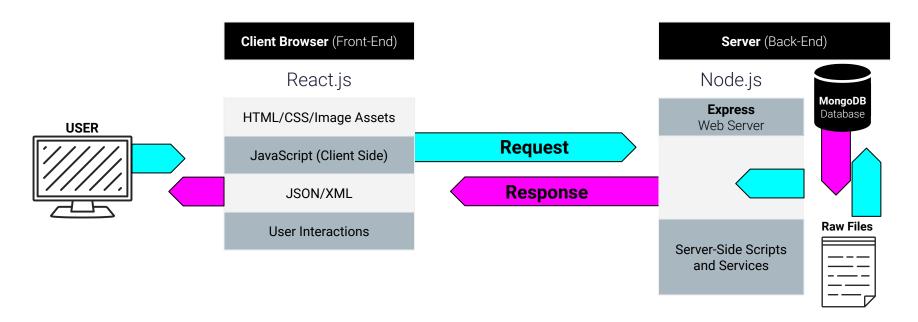

```
<script src='http://code.jquery.com/jquery-2.1.3.min.js'></script>
 8 ▼ ⟨script type="text/javascript"⟩
       var type = 'the+matrix';
       var queryURL = "http://www.omdbapi.com/?t=" + type + "&y=&plot=short&r=json";
10
11
12 ▼
       $.ajax({url: queryURL, method: 'GET'})
         .done(function(response) {
13
            console.log(response);
14
15
        });
16
   </script>
                                                 'GET' method
```

# **Knowledge Is Power**

# Welcome to Full-Stack Development

**Full-stack development** refers to the development of *every* aspect of the web application, from visuals and interactions to data transfer and processing.

AJAX and APIs

### **AJAX and API Overview**

### At this point, you should know:

The definition of API

02

The definition of JSON

(03)

Why AJAX methods are used (i.e., retrieving data in databases).

 $\left(04\right)$ 

How to create a basic AJAX get request using jQuery (i.e., include URL and 'GET').
